

## 305: MOUTHPIECE

Mouthpiece is a social media app that is used to share posts, pictures, and videos for a community of those interested in sports. This app connects athletes, sports fans, coaches/recruiters, team members, trainers, and tournament organizers. The athletes can gain a fan base by posting pictures, videos, and highlight reels which give exposure to coaches/recruiters. As for the recruiters, they can find out players' capabilities and keep track of players' statistics. Trainers can find and help develop players by professionally training them, for example, in shooting the ball. The tournament organizers can use this app to make things easier so that players can create a team while putting in the statistics and ranking. The teams can use this app for player scouting, where they can study the player's strengths and weaknesses and the position they play.

Mouthpiece is an app that helps sports fans show their skills. They might get scholarships or jobs because of the app if they are good at it. Our group has front-end and back-end members. The front-end members work on how it looks, and the back-end members work on how it works. Front-end developers use a program called Figma to make the app look nice. Back-end developers create a database to store information like user's profiles, team's profiles, tournaments, etc.

This app is for sports fans. It helps them share their stuff with more people. Other social media like Twitter, Instagram, or TikTok might not be the best for sports because there is a lot of other content on those apps.
